

PROPOSED PLAYTEST INSERTS - print at 100%; cut on outlines

Review notes: fit these cues into Liv's props after testing. Balance slip requires a cache mark and a calibrated coin pile.

Start here

Keep every postcard and ticket, even after it has helped you open something. Read both sides. You may separate papers and use the tools provided; nothing needs force. The first postcard starts your journey. Ask for a hint whenever the trail goes cold.

Two SKies

Those two northern skies belong together. Put the picture sides face to face, turn one card half a turn, and line up their top edges against a bright light. Look closely along the join.

Walking through words

The four word-pairs mentioned in my Rouen message give four journeys on the map, in the order I mention them. Either word in a pair counts. Match each pair on the ticket: letter first, number second. Start at its picture and count grid steps to its square. Count the moves, not the starting square.

Reading the balance

Sort the coins by their marks. Weigh the pile whose mark matches the cache. Use grams, with the scale empty and zeroed first. Ignore the last digit after the decimal point, then ignore the dot. Turn the remaining four digits upside down. What word do they become?

Our three-move challenge

This is our own little puzzle: only the king moves. All other pieces stay fixed, and none are captured or jumped over. Slide in a straight line along a row or column. Reach any corner in exactly three moves. Count the squares travelled on each move, excluding the starting square.

The whole journey

Group the postcards by their stamps. Use my family drawings to choose the stops to trace; set the other cards aside for drawing, but keep them for reading the tickets. The first origin and final destination of each travel ticket join my journeys. Use the journal and postcards to order the stops within each journey. On each map, join the chosen place dots with straight lines in that order. Keep north at the top and read each route as a digit. Follow the ticket chain to put the four digits in order.
